yes	Deceased	Sadly Cuilly had to be put to sleep following Cluster fits, then 4 hours later another really bad fit	
<b>Suspect Stimulus:</b>		<b>Medication:</b>	<b>Food prior to onset:</b>

3

The fits came every time out of the blue and from nowhere. There never seemed to be a reason. In between times she was fit and acting normally and always keen and happy to work at her Obedience Prescribed medication: For a year she was on the maximum medication. My Vet consulted with Fitzpatrick to confirm levels	EPIPHEM x 90mg twice daily LEVETIRACETAM / KEPPRA 500mg 1 x 3 times daily INCURIN 30mg x 2 once daily DIAZEPAM RECTAL TUBES 10MG	No change of food either before or after
---	---	--

<b>Neuter:</b>	<b>Frequency:</b>	<b>Comments:</b>
Spayed well before fits started	1st fit was Aug 2014, then Oct 2014. In Nov 2014=Cluster fits when had to be sedated. Then approx. monthly from then on, apart from Aug-Oct 2015 when she went 17 weeks without a fit. Nov 2015 one minor fit and finally Dec 2015 Cluster fits	Sorry I have nothing more that can help you

Whiz had 2 fits within 2 hours Sept14. Vet advised "wait and see". No further fits until May 15, 2 fits in an hour. Each fit under a minute. Decided not to medicate hoping fits would be very infrequent. July 4 fits in an hour, taken to vet, admitted, 2 further fits. Medicated. 19thSept 5am went into status, died in my car on way to vet. Prescribed medication: Diazepam given during cluster in July, started on Epiphen, 30mg twice a day. Bloods checked in Aug and Sept (only a few days before he died) all ok, epiphen levels and liver fine.		Diazepam given during cluster in July, started on Epiphen, 30mg twice a day. Bloods checked in Aug and Sept (only a few days before he died) all ok, epiphen levels and liver fine.	Raw fed before and after onset of fits. I did not change his diet at all.

21

Neuter:	Frequency:	Comments:
Neutered age 1 ( 5 years before onset).		The day before two of the clusters Whiz had been swimming in the sea, I wondered if this could have been a trigger, but he he had not been to the sea for two weeks when he died. I have no idea what his triggers could have been.

Suspect Stimulus:	Medication:	Food prior to onset:
She started having epilepsy at around the age of 4 or 5 I think, with one fit which lasted probably less than a minute.They never actually lasted more than a minute I would guess, just seems a long time at the time. They gradually increased until about 18months - 2 years months later when she had 5 in one day, the vets then put her on medication - Phenobarb? I believe.This stopped the fits until the dosage needed correcting. Megan had to have regular check ups every 6 months (I think) and the medication did gradually increase. Megan actually contracted Bone Cancer in her shoulder which sadly ended her life at the age of 10 1/2. That's about all the information I can give you I'm afraid - hope it helps in some way.	Phenobarb

Fits began aged 18 months. Vet confirmed as Epilepsy. Medication: Pexion 400mg twice daily. Initially fed on skimmers kibble then once the fitting started, a home prepared diet of brown rice, potatoes and vegetables with raw meat( to try and reduce gluten, corn, soy and casein as per the GARD diet) This seemed to help for a while, with improving gaps between fits until last week, when he had several fits and he became critically ill at the weekend with cluster fitting. Fits have change in frequency. We had got him up to 17 days between fits, and had wanted to try and manage it naturally ( without drugs) but that all changed last week as described above and the treatment was necessary to save his life. After we got him, we heard that the dogs ( not the bitches) in the previous litter had all started to fit. So we opted for an early castration at 5 months. We are very lucky that he is still with us, but it was devastating to see him so poorly. He was in intensive care for 3 days and has been home for 3 days now, improving visibly by the hour. If I can provide you with any additional information,

Pexion 400mg twice daily

Initially fed on skimmers kibble then once the fitting started, a home prepared diet of brown rice, potatoes and vegetables with raw meat( to try and reduce gluten, corn, soy and casein as per the GARD diet) This seemed to help for a while, with improving gaps between fits until last week, when he had several fits and he became critically ill at the weekend with cluster fitting.

<p>confirmed as Epilepsy. Medication: Initially Pexion, after 6 weeks Libromide was added This combination was satisfactory for a while but then fits resumed, if anything worse than previously, he then had Epiphen and also Diazepam. Neutered after onset of fits. From the outset His fits were severe and caused significant memory loss and required a lot of retraining etc. We had a honeymoon period when we thought that the medication was going to control the seizures but when they resumed each time he had one it was severe and the recuperation period took longer. He had a very severe cluster of fits which effectively wiped his memory and character. He was very close to death but pulled through. We taught him to walk etc again and after 6 weeks he was basically ok. He was a different dog but he liked us and was content in his life. He then had another severe seizure during the night which left him parylised from the shoulders. We then made the decision that he should be pts. 1st June 2015 aged 3 yrs and 5 months.</p>		
	Epiphen and also Diazepam

Has had two seizures eight days apart in June 2017. Was seen by vet immediately after first seizure and haematology and biochemistry were all normal. Was referred for MRI which was also normal. Both seizures lasted 2-3 minutes approximately and recovered quickly. Second seizure was slightly worse and he lost control of his bladder. Unsure of triggers as first was out on a walk and second agility training. I do however think stress/overarousal could be a possible trigger.		Diagnosed with idiopathic epilepsy after second seizure prescribed 60mg epiphen and has remained on this dose, bloods are done to check levels and he tolerates the drug well. Has had no further seizures whilst on this medication.	fed Millies Wolfheart and has been for years, no change to food prior or after seizure
<b>Neuter:</b>	<b>Frequency:</b>	<b>Comments:</b>	
yes, years before first seizure	has only had two seizures

First seizure March 17 in the vets reception after dental exam. IV Diazepam given - vets thought could be stress related. On 10/06/18 whilst in garden playing, she had an extreme head tilt which lasted a few minutes. On 29/06/18 at 10am she had a full seizure whilst resting in kitchen with me present. Taken to vets at 3.45pm where bloods were taken. Given 2 x 5mg rectal diazepam in case of further seizures. At 6pm that evening she had another, more intense seizure.		Initial blood tests are all clear. Now on 1 x Phenobarbitone (Epiphen) every 12 hours. Also have 2 x 10mg of rectal diazepam in case needed. Have got to go back to vets in 14 days for revised blood tests.	Had usual Bonio in morning plus grated cheese (nothing usual).
<b>Neuter:</b>	<b>Frequency:</b>	<b>Comments:</b>	
Speyed well before first seizure	The 2 on 29/06/18 both started with lip twitching then head went right over her back. Severe paddling on floor. 2nd seizure she was walking into cupboards and seemed more disorientated - latest one was more intense and urinated (managed to video after giving rectal diazepam). Afterwards she paced in garden & you could hear her feet dragging. Very wobbly.	Called vets who wanted to put her on seizure watch which was a great relief to me knowing she was in the right place. However, she became very stressed and so they called us after about 2 hours to collect her as they felt she would be better off in own environment. I sat watch all night and although restless at first she slept well. Was given 2 x 10mg of Rectal Diazepam if needed.

<b>Suspect Stimulus:</b>	<b>Medication:</b>	<b>Food prior to onset:</b>
Started fitting out of the blue with no warning. First fit was probably the worst of all he had & he came very close to death from it. No pattern / cause / reason for the fits. Some have occurred when he has been wound up or over excited, such as when setting off for a walk, some just when he's resting & some while he's asleep.	Pexion initially, dose changed several times. Following increased regularity of seizures is now also on Phenobarbital, the dose of which has also been increased. Currently on 400mg Pexion & 60mg of Phenobarbital both twice daily.	Has been fed on Challenge kibble since I got him. I don't believe his fitting is food related.

<b>Neuter:</b>	<b>Frequency:</b>	<b>Comments:</b>
No	There is no pattern to his fits / seizures.	Maternal grandmother had 3 fitting siblings. Her sire has also sired other fitters.

<p>Idiopathic Epilepsy. Medication: 40mg of Pexion twice a day. He was flea treated a week before, to which he was stressed at time of doing so and was off colour from that point up to first fit. He was feed on mainly raw with some dry food. Had an allergy test done and he is allergic to chicken, duck, wheat and gluten. Changed to pure BARF diest minus the chicken and duck. In himself he became brighter when food was changed, he started to grow again, coat became fuller. His fits have become less frequent but this may coincide with having all possible test done, including an MRI scan and spinal fluid tap, to diagnose epilepsy and being put on the right medication. When they first started he had several in a week, once food changed these decreased and since medication started they have decreased further. Longest between fits has been 31 days.</p>		<p>feed on mainly raw with some dry food. Had an allergy test done and he is allergic to chicken, duck, wheat and gluten. <p>vet confirmed idiopathic Epilepsy. No identifiable cause for fits. Medication: Pexion 400mg twice daily. One small fit on 28.06.13 whilst asleep on sofa lasting less than a minute, recovered within 10 mins. No further fits until 9th July, when found fitting in the morning. Rectal Diazepam given. Fitted again same day at 3pm, same treatment, but 4 further fits, taken to vet, kept overnight and stabilised. home on the 10th but fitting again between 11am and 2pm so back to vet and again kept in overnight and sedated, Phenobarbitone and on a drip. Prognosis was poor at this time. Brought home on the 13th July, Pexion 400mg twice daily. Recovery seemed unlikely but daily improvements noted - motor function, spatial awareness, vision, recognition. Following 22 days charted phenomenal progress in physical and mental capabilities, by 1st Aug he was at 95% of his previous levels of Obedience training. On 2nd August he had another brief fit at 10pm (similar to his first) with the same outcome. At some time between 3am and 4am on the 4th Aug he suffered a major seizure, rectal diazepam x 3 was administered but to no avail, and he passed</p>	<p>Rectal Diazepam given. Had hormone problems, extended heats and very frequent. Was being seen for this and plan was to desex. Had one fit, witnessed. Was mild, turned blue, fell over, only a few seconds, awoke, perfectly clear and normal. No fits for several wks, then had a fit in the night, grand mal, severe, clusters, taken to vet and put to sleep the next day, vet unable to stop them. Unsure if this was caused by epilepsy or some other problem. Vet could find no sighs of tumors, heart problems and all labs normal.		at vets, unknown.	grain free diet
<b>Neuter:</b>	<b>Frequency:</b>	<b>Comments:</b>	

No	This dog lived in the home and slept in my room and was seldom left at home alone, I do not think she was having un-witnessed fits.	Dog is also ISDS registered Ginge 00/329143 Breeder notified. Broken hearted, she was an angel.

First fit was in November 2015. she went from totally fine, then had about 6 full on seizures in 24 hours The fits started by her staring into space, then freezing rigid, keeling over then shaking violently for 30 to 90 seconds. She'd then slowly came round and looked pretty spaced out and tiredœ There was no obvious trigger to them.		Once we got her to the vets she was sedated, started on the drug intravenously. She came home 24 hours later and over the course of the next two weeks she became less spaced out and her behaviour returned normal 2x30mg of Phenobarbital.	none
<b>Neuter:</b>	<b>Frequency:</b>	<b>Comments:</b>	

spayed no change		As the Breeder of this litter I have made all the puppy owners aware that two bitches and one dog out of the eight have developed epilepsy. I own one of the pups from this litter and there is not a day goes by that I am not reminded of the Epilepsy. I strive very hard to be the best breeder and do all of my research responsibly. Unfortunately, information relating to potential problems, had not been published on the data base prior to mating and I had not been made aware of any epilepsy in the line. None of these puppy's owners will be breeding from their dogs and this line is closed.

he still has his seizures but they seem to be more under control. He had the original block of 3 in a day then a wait of 11 weeks, another 3 in a day, then no more for 3 weeks, then, oddly, a random one when playing in the garden. But this one was a very short and quick recovery. Hopefully that means that the medication is really working.

<p>Fitting began aged 16 months. Not vet confirmed as Epilepsy. Medication: see below. First fit 28.10.14 - seizure in the afternoon, followed by a slow but full recovery to normal state. Second fit 29.10.14 at 7am. Seen by the vet after each seizure and blood tests undertaken. Vet advised diagnosis of idiopathic epilepsy at this stage but as yet no MRI or spinal tap has been carried out. He is otherwise fit and well with no further seizures as of 2.12.14 .. Bloods have been sent to Epiphen to assess viability of phasing out medication. 24.9.14 castration under general anaesthetic; vet treated with Advantage for possible fleas same week; 1.10.14 first year vaccination; 25.10.14 routine worming with Panacur. He is otherwise fit and healthy. dam &amp; littermates will never henceforth be bred from. DNA to be submitted in due course. Neutered on 24th September, before onset of fits. Update 1.5.15 Bryn suffered a seizure at 10.30pm. Recovery time was quicker than the initial two seizures last October but he lost vision for 15 minutes. 25 minutes after the seizure he took his ball to</p>	<p>Initial course of Diazepam for approximately one week; treated with Epiphen twice daily from day of second fit for four weeks. owners report that his epiphen dose had been reduced gradually to 1/4 tablet each day (as he had suffered no further fits after the initial two) with the plan to take him off meds altogether in another week. However, their vet has now advised that the dosage should be returned to 1/2 tablet each day.</p>	<p>Fed James Wellbeloved Turkey &amp; Rice; no change before or after seizures.</p>

<p>Fitting began aged 4.5 months. Vet confirmed as Epilepsy. Nothing unusual happened although breeder says could be any number of influences such as sofa, underfloor heating river water etc. No relevant injury but has been treated by chiropractor of misaligned pelvis in past two weeks. . 4 fits so far each approximately 10 days apart. Medication commenced 23 June 14 - too early to determine. MRI scan to be carried out 2 July. Entire. 20.07.14 Up date. Kez had MRI &amp; Spinal Tap at R Vet College 2nd July, result 'Unremarkable' therefore epilepsy confirmed. Epiphen 60mg twice a day. Due to the way the fitting started Consultant thought that I should expect Kez to fit every couple of weeks but so far he has been clear and in good health showing no effects of the drug. Consultant did not feel that I should go through the same procedure with my other, related, BC as the result would likely be the same. update 2.10.15: Kez, after starting medication in July 14 very few isolated fits but they resumed in Sept 15 as clusters - at least 6 in 24hours. Vet added Libromide, 325gms a day after a 5 day loading period. Also Epiphen 90 2 x daily. clear since 4 Sept, Frequency: No fits from July to Feb after</p>	<p>Medication: Skull Cap Valerian. Silica Agorica &amp; Ignatia. Epitaur</p>	<p>Fed on Raw food - minced chicken carcass/lamb chicken wings, lamb ribs, tripe, minced vegetables, some soaked oats - no change in food fed. DE &amp; turmeric paste No change in diet but have now removed all traces of dairy, gluten &amp; grain.</p>

<p>Fitting began aged 2 years 6 months. vet confirmed as Epilepsy. Medication: Homeopathic meds. Skullcap Valerian/Silica/Thuys Verm x. Nothing unusual happened that might have caused the fits although the breeder suggested that sleeping on the sofa might be the cause. - there seems to be many fitters in breeders lines. Fed Raw - Natures Menu No change to diet since fits began. First episode lasted approximately 90 seconds with full recovery after 30 minutes. Subsequent episodes - 5 over 36 hours much more intense and lasting around 5 minutes each time. Neutered around 16 months - First fit 9 April 2014 so neutering not thought to have had any impact. 20.07.14 Update to Rosmarinus Golden Crown. Further cluster fitting 7 weeks after previous episode, vet have prescribed Pexion 400 2 x daily as homeopathic medication was not effective. I discussed Switch's condition with Consultant at R Vet College - it was his opinion, that due to pedigree history that there would be no benefit an MRI scan and spinal tap. If severe cluster fits in future has recommended Keppra be prescribed. Otherwise Switch is in good health currently. Update 2-10-15 Fitting</p>

Fitting began aged 2 years 6 months. Not vet confirmed as Epilepsy.  
Medication:Phenobarbitol. Had seizures weekly until medicated, and then went to one or two a year until he died. No known triggers, dog usually fitted whilst resting. Unsure what he was fed but his owner said they never felt food or medication was a trigger. Kept entire and lived until he was 15 years old, died of a suspected stroke and went off back legs .

Phenobarbitol

Fitting began aged 21 months. Vet confirmed as Epilepsy. Medication: Phenobarbitone . Proplan Performance dried food mixed with Nature Diet. Too early to say if there has been any changes in fitting. UPDATE. Continued on meds, next cluster June 2014. Couldnt stop them so vet medicated and they finally stopped. Next fit August 2014 5am. Tried numerous diazapam to stop fit but couldn't. Vets had to put her to sleep. She was only 2 years 8 mths.

Phenobarbitone

Fitting began aged 3.5 years. Not medically confirmed as Epilepsy. Medication: None. Dog vomited 6 times at hourly intervals, starting approx 1 hour after food. First fit was shortly after last vomit. Owner had own health issues and eventually decision was taken to give sleep to the dog. Vet could not rule out Idiopathic Epilepsy. Neutered prior to prior to fitting.

<p>Fitting began aged 11 months, not diagnosed until 15 months of age. Vet confirmed as Epilepsy. He was eating quite a lot of cheese for training and as trick training. Vet said cheese can trigger seizures in some dogs. Suffers from focal seizures affecting his back right leg. After a severe one at 15 months lasting over an hour, decided to medicate. Vet prescribed 30mg Epiphen, twice a day. Was fed on a complete natural wet food and some kibble until diagnosed. After research switched to raw feeding. He is now fed on Natural Instinct food and Natural Instinct treats. I can't stress enough how strict we follow this diet, he never gets any human or dog treats that are not his own. As he was seizure free for 6 months on medication, Vet suggested taking him off medication. He has now been off tablets for a month and has been seizure free. Entire.</p>		
	30mg Epiphen, twice a day.

<b>Suspect Stimulus:</b>		<b>Medication:</b>	<b>Food prior to onset:</b>
Fitting began aged 4 years 7 months. Vet confirmed as Epilepsy. Medication: Epiphen 60mg twice daily - first prescribed 29.12.14 .He had a bad ear infection and was sedated then anaesthetised where his ear was flushed. We originally thought he had something in his ear as he was head shaking. With the drug Epiphen in his system the fits are less severe though still as debilitating but not for such a long period. He was neutered before the fits began. He had a retained testicle-removed early on then a benign lump in the remaining testicle/overgrowth of hormonal cells. the testicle was removed in 2013. He is on Green Dog Turkey and Rice kibble and has always been on this food. It has never been changed		Epiphen 60mg twice daily - first prescribed 29.12.1

<p>The dog began aged 3 months. Vet confirmed as Epilepsy. Medication: Initially Valium and Phenobarbitone. Then Potassium Bromide and epilim added after specialist advice. Doses systematically increase which increased the space between fits but did not reduce the intensity when the cluster fits happened. These required large doses of iv vallium and Phenobarbitone for 12 hours. iv dexamethasone was given the following day and subcutaneously the next 2 days. No changes made to diet. First few were single fits then every fit was a cluster fit. Response to increased medication doses was to increase the time between fits. There were no fits between Feb and June 92 then the intensity got increasingly worse. Neutered on Vets advice, but made no impact on fits. Euthanised in July 1992 when fit frequency increased to less that 1 week between clusters and the drugs were affecting his liver. His personality also changed and he lost the ability to remember simple commands.</p>		Initially Valium and Phenobarbitone. Then Potassium Bromide and epilim added after specialist advice.
