

PBHF Fitting Database - NON PEDIGREE REGISTERED

***** IMPORTANT *****

This database contains those dogs not KC pedigree or ISDS registered. Many are registered on the working registration as Working Sheepdogs. Some entries have no known pedigree and may not be collies.

Dot only ever had ONE almost fit , that came on 60 minutes after whelping. Diagnosed as pre- eclampsia. Treated with s/c calcium and magnesium for 2-3 weeks. Never fitted previously, and no further fit-like episodes afterwards. At age 14-15, started having drop attacks, where she would lose consciousness after making strange howling noises. Diagnosed as secondary to poor cardiac function, and she stopped having them after starting digoxin.		digoxin	na

Had MRI scan, neurological work-outs etc at both AHT & heart specialist nr Guildford as he mostly fitted during exercise. Now on half a Libromide per day as stopped fitting 8.5 years ago. (26 fits in 3 years). A litter brother also fitted and had very bad fits at the end of his life	Libromide, then added Phenobarbitone, also tried homoeopathic remedies.

Fitting began aged 13 years old. NOT Vet confirmed as Epilepsy. Medication: None. specified. Nothing unusual happened that might have cause fitting to start. Fed on IAMS Dog Senior & Mature (Dry Food). Had a total of 10-12 seizures within a period of less than 20 hrs. They occurred either every 2-3 hours or when he lay down (whichever came first). Until that day he had NEVER had any seizures. No longer alive.

<p>Fitting began aged 31 months. Vet confirmed as Epilepsy. Medication: Initially Homeopathic, then Epiphen 30 twice daily. First fit happened a few days after Advocate applied. 3 months later 6 fits in 10 days went to homeopathic vet got them under control until firework night when he had 10 over 3 weeks my usual vet prescribed Epiphen 30 twice daily he went 13 months clear until new years eve fire works epiphen increased to one & half twice daily he has been clear for 18 months but for the firework weeks i put an Adaptil collar on Tonic he was very stressed before putting it on him it was like magic 2 minutes after putting it on him he got a toy to play with then went in his bed and slept for the evening . Fed on raw food, fits improved since medication began. Neutered once fits were controlled.</p>		Initially Homeopathic, then Epiphen 30 twice daily

Fitting began aged 2 years 6 months. Vet confirmed as Epilepsy. Type of food she was on appeared to make no difference. Fits gradually became longer and more severe. She was spayed after fits started, but made no difference. Fits became so severe and frequent, medication failed to control them. Eventually quality of life was compromised and she was given sleep at 8 years old.		Phenobarbitone, potassium bromide, Keppra, gabapentin.

Suspect Stimulus:	Medication:	Food prior to onset:
Fitting began aged 3 months. Vet confirmed as Epilepsy. Medication: Epiphen and potassium bromide. Owner reports severe vaccine damage at age 9 weeks, confirmed by vet and reported. Dog always had major problems with absorption of protein (PLE) from vaccine damage - diet changed frequently to aid absorption, but cannot tolerate grains, rice, chicken. No change on medication. Petit mals became more severe until medication prescribed at age 2.5 years. Now responding reasonably well to medication.	Epiphen and potassium bromide

Every fit was at the beginning of exercise. There was 3 months between the first and second fits then roughly monthly for a year. Then they became more frequent over the space of a year until she was fitting regularly including at night. At this stage there was no common factor for the fits.		I' think she started on a low dose of phenobarbitone which was then increased. When she was fitting regularly her drugs were changed but I can't remember the name.		No changes recommended

Suspect Stimulus:			Medication:	Food prior to onset:	

<p>Fits began aged 1 year 10 months. Vet confirmed as Epilepsy.</p> <p>He had cluster fits over 2 days on the first occasion and was given medication to try to stop the cluster, it was then 18 months before his next cluster fit. His next fit was then 3 months later, after which the frequency increased from around the age of 4 until the fits were happening every 3ish weeks. It was often a cluster of 3 or 4 fits over a couple of hours, but he needed veterinary assistance on 2 occasions where he was anaesthetised to stop the fitting as the episodes had continued over 24 hours or more. NOT neutered as the vet advised against him being operated on because of the risks with his epilepsy. Dog is no longer alive.</p>		<p>initially prescribed just Epiphen, but over the next 5 years his medication was gradually increased to try to control his fitting. From his first fit, he didn't have another for 18 months then the frequency increased until roughly every 3 weeks by this time he was on 120mg Epiphen at 8am and 8pm, 300mg galbapentin at 8am, 2pm and 8pm, 500mg Keppra at 8am and 8pm, and 250mg at 2pm</p>	<p>He was on Autarky at the onset of the fits but as the intensity increased, he was moved to a completely natural diet of chicken and vegetables. Much research was carried out into the ingredients of manufactured dog foods, and it was found that certain things can be a trigger factor to epilepsy so knowing what was in his food was important.</p>

Fitting began aged 2 years 7 months. vet confirmed as Epilepsy. Medication: phenobarbitone 60mg 2 x day, now increased to 90mg 2 x day, plus potassium bromide 400mg 1 x day and keppra for 5 days if seizures (4 x 500mg) . Fed on Advanced Formula for Working Dogs dry food, have not changed this since diagnosis. Too early to say if fits have changed at all, first seizures 6 in 36hrs, each lasted around 1-1.5 mins, generalised with legs paddling, teeth chattering and unconscious. Next ones 3 wks later, 6 in 3.5hrs, shorter duration, 30secs to 1 min, semi conscious, back arched and rigid but shaking body, jaw rigid and wide open, looked more traumatic. Spayed after first season around 9 months

He had a fit yesterday 7-7-2016 while out for a run the last one he had was 9 days ago before that he had gone about 5 months

he also has a very itchy body he is always licking or scratching himself and he is put onto Prednisolone every now and again just to give him some relieve.

I've kept a diary since his first fit which was in Oct 2015 and at first we thought it was a supplement oil we put in his food. we stopped it but found it carried on regularly until it clustered and we had to put him on meds. they were 3 weeks apart within a day each time. then he had 2 in 3 hours.		Prescribed medication: He started on Epiphen 45mg twice daily He has blood tests 3 weekly and after each blood test his dosage has been increased by half a tablet each dose. He is now on 75mg twice daily. He also has diazepam incase of severe fitting of 5 mins	Bears first seizure was at 6.30 in the morning, he'd last eaten at 5.30pm the evening before. He is fed natures diet which is cooked, he has that with pedigree chum mixer for large dogs. Most fits are between 4.30am and 6.30am when asleep
Neuter:	Frequency:	Comments:	

35

He was neutered at 9 months old and had not fitted until Oct 2015	Since he started his meds he's not fitted. though after blood tests they do keep increasing his dosage. He has now been 6 weeks fit free.	Bear is a very large Collie weighing around 34kg. He came from a working farm in Wales as was his older brother who is coming up 3 with no signs of the same.

<p>Fitting began aged 3 years 6 months. Vet confirmed as Epilepsy. Medication: Epiphen only at first and progressed to potassium bromide as well. Was also on Keppra for nearly two years but has been weaned off with no noticeable change. Fits increased in frequency initially to 2 to 3 per week. After visit to neurologist and a dramatic increase in amounts of medication he went 19 weeks without an episode. When they commenced again he fitted every 2 to 3 weeks and then gradually increased to more than one or two a week again. Introduction of Keppra halted this progression and although Keppra now discontinued he fits on average every 4 weeks at present. Neutered.</p>		<p>Epiphen only at first and progressed to potassium bromide as well. Was also on Keppra for nearly two years but has been weaned off with no noticeable change</p>

Fitting began aged 8 years 1 month. Vet confirmed as Epilepsy. Medication: Epiphen. Started on 30ml twice a day and progressed to 45ml which seemed to work. Almost all fits happened immediately after running & diving on a ball or tuggy. As he lifted his head with toy/ ball in his mouth he stiffened, and then 'keeled over' into a fit. Over the course of first month I took him to a McTimoney nurse who found that several vertebrae were slightly misaligned in his back / neck. Stopped throwing a ball for him after the third fit. That, together with medication virtually stopped the fits. He only had one or two a year after that, usually when he dived after someone else's ball! Neutered years before onset of fits. Died Cancer of the spleen in April 2012.

Epiphen. Started on 30ml twice a day and progressed to 45ml which seemed to work.

vet confirmed as Epilepsy. I did notice it initially happened after we had been out in the rain. Like he had caught a chill it happened often after a soaking the vet said it wasn't connected. After diagnosis at Bath Vet hospital where he had an MRI and I think a lumbar puncture he was Initially given just Epiphen strength and dose varied then also given Lobramide can't remember strength when fits continued. The fits did change even though he was on medication. The fits didn't last as long and I could tell when he was about to have one, or if he had had one when he was home alone. Usually when he was sleeping then he would wake, his head would shake he would fall over and his back legs would move as if he were running his front legs would be stiff. Was fed on Bakers complete. A lighter diet was offered after fits although he was usually starving when he came around . He gained weight so we were advised to give him a weight control food there was no change in fits. He fitted off and on for just over a week in clusters. We arrived home one evening to find that he had died. The vet said it was a grand mal seizure that only instant medication could have saved him. neutered before the fits began.

Suspect Stimulus:		Medication:	Food prior to onset:
<p>Fitting began approx age 2 years. Vet confirmed as Epilepsy. Medication: None. On keeping a diary fits always on around spot on flea treatment - not now used and fits a lot less severe and less frequent, plus have changed his diet to part raw.and don't give any vet meds unless v necessary (use alternative and herbal) and ALWAYS check they are suitable for dogs with seizures. Fits always in a morning after a deep sleep but have been able to halt them when I see and hear the signs (vomiting noise and lip licking)and talk to him and stroke him gently. Now fed part raw part JWB kibble. Did read an article about giving frozen vanilla ice cream immediately after a fit. Have only tried this once but was AMAZING at bringing him round very quickly. Fitd have gone from every 3/4 months to every 5/6 months (last time was 5months 22 days) and are less severe now lasting less than 1 min and recovery time afterwards a lot quicker (due to Ice cream?). Dog came from a rescue and was neutered before owner got him.</p>

Fitting began aged 13 months. Vet confirmed as Epilepsy. • Fits started of as around 8 or 9 clusters every 21 days, and this has increased to 11, his last one being 16 clusters from 2pm to 7 am the next day. Some last 30 to 40 seconds, some 2 or 3. There is usually 15 minutes in-between but now a few minutes. Clenches jaw, then jaw wide, outstretched legs urinates sometimes, and a slaver from mouth and the smell is awful. Then he will pace, used to be pace for 20 minutes, and could not see us. Now he paces and tends not to bang into objects, seems to manoeuvres around them a little better. Before a fit, he howls at the moon, tries to escape, but now he tends to approach me to cuddle, and follow me everywhere I go. You can see in his eyes that he is due to fit, his personality changes. The fits had increased to double the amount, but more oftem between them . Neutered before fits started. He had been neutered only 4 weeks before • He had trauma to his leg when only 5 months • And we had a collie put when he ceased the following week

Medication: Epiphen an increased to 2 twice daily 60mg, After 4 months given Libromide, which only made him lethargic and not acting like his usual self Now on Epipen and levetiracetam which we used to give him now and then before a fit, but not on one every 8 hours

<p>Fitting began aged 4 years 7 months. vet confirmed as Epilepsy. Medication: Initially given Phenobarbitone, 60mg 2x daily. continued to cluster fit, medication was increased to 90mg 2x daily and given potassium bromide, 975mg once daily. The potassium bromide later caused disorientated mental status and occasional falling while standing or walking. Once the potassium bromide was withdrawn and replaced by gabapentin he was back to his normal alert self. Currently on 105mg Phenobarbitone 2x daily and 300mg 3x times daily of gabapentin. When he fits he is given rectal diazepam and an ice pack is applied to his neck/back area. now fits approx. every 10 to 15 weeks and generally only has one fit instead of the 4/5/6 cluster fits within the space of 1 to 4 hours he was having every 4 to 6 weeks. Neutered after being diagnosed with idiopathic epilepsy. Neutering made no difference to the pattern of his fitting. The dam was spayed and the owners of his litter brothers and sisters were advised to neuter/spay which all did. Our dog is the only one from the litter from this parentage that has fitted out of 11 puppies. They are now 10 years old and all are healthy.</p>	<p>Initially given Phenobarbitone, 60mg 2x daily. continued to cluster fit, medication was increased to 90mg 2x daily and given potassium bromide, 975mg once daily. Suspect Stimulus:		Medication:	Food prior to onset:		
Possibly milbimax wormer having been used. Possibly injury from fall of equipment at agility. Had a seizure within a few days of peppermint essential oil mixed with water being sprayed.		Emergency Diazepam 10mg	Was on CSJ That'll Do have now changed to a grain free with no rosemary.		
Neuter:	Frequency:	Comments:			
Yes but was done a few years prior to onset of first seizure	Still sporadic. The last seizure was in the morning whereas all others have been in the evening/night.	I am now using natural flea/tick treatments, haven't wormed her but have her checked for worms, I will not be vaccinated her which is due in November. Done more training on calming games so she doesn't get so over stimulated at agility.

Epilepsy Confirmation:	Alive:	Cause of Death:	
yes	deceased	Death at 15 yrs was unrelated to the epilepsy	
Suspect Stimulus:		Medication:	Food prior to onset:
Excitement eg Chasing a bird that suddenly landed commonly brought on a fit.		Phenobarbital	
Neuter:	Frequency:	Comments:	
Castrated at 18 months, 3 years prior to commencement of fits.	Fitted approximately every 6 weeks for first 6 months. I policed all sudden excitement scenarios and then seemed to fit only twice a year until the age of 8. From age 8 to death he never had any further fits.

<p>Fits began age 7 months. Vet confirmed as Epilepsy. Medication: began after 4 months of increasing clusters. Meds stabilised at 90mg Epiphen 2x daily + 325mg Potassium Bromide 2x daily. Fits varied in intensity from infrequent/partial to sever & clusters. Neutered age 12 months as Cryptorchid. No effect on seizures. Euthanised aged 5.5 years due to Liver failure from increasing levels of Epiphen. Born into a litter of 4, Mum & siblings neutered when diagnosed as Epileptic.</p>	<p>Meds stabilised at 90mg Epiphen 2x daily + 325mg Potassium Bromide 2x daily.</p>
